AND
STANDARDIZED
FIELD SOBRIETY
TESTING**

SECTION H.

PURPOSE OF THE COURSE

Purpose of the Course

The fundamental purpose of this training course is to foster DWI deterrence, i.e., to dissuade people from driving while impaired by increasing the odds that they will be arrested and convicted. This course is based on the assumption that a principal reason for enforcing DWI laws is to deter those who might otherwise be tempted to drive while impaired. If potential DWI violators believe that there is a real risk of being caught, it is reasonable to believe most will refrain from driving while impaired.

Police officers can't possibly detect and arrest all DWI violators. Not all who are arrested will be convicted and punished. However, officers can improve the skills that increase the chances of detecting, arresting, recording, articulating, and gathering sufficient evidence to sustain a conviction.

The training is based on the premise that officers perform two fundamental tasks which affect the likelihood of apprehending and convicting impaired drivers. The first of those tasks is detection. In this course, "detection" is defined as "the entire process of identifying and gathering evidence to determine whether a suspect should be arrested for DWI." DWI detection begins when an officer's attention is drawn to a particular vehicle or its operator. The precipitating events are unlimited. The initial "spark" that causes the officer to focus attention on the particular vehicle may carry with it an immediate, strong suspicion of the possibility of

impairment; or, only a slight suspicion of the possibility of impairment; or, depending on the circumstances, no suspicion at all at that time. Regardless, it sets in motion a process in which the officer focuses on the particular individual and has the opportunity to observe and elicit additional evidence.

The detection process ends only when the officer formulates the decision either to arrest or not arrest the individual for DWI. That decision is based on all of the accumulated evidence. Effective DWI enforcers do not leap immediately to the arrest/no arrest decision. Rather, they proceed carefully through a series of intermediate decisions, each of which can elicit evidence. The course clearly outlines each decision step.

Successful DWI detectors are those officers who know what to look and listen for, who have the skills to ask the right questions, and choose and use the right tests. They are highly motivated and apply their knowledge and skill whenever they contact someone who may be under the influence. In this way, they tend to make more DWI arrests and gather the best possible evidence to support their charges.

The second basic task of effective DWI enforcement is description. Just as detection is the process of collecting evidence, description is the process of articulating evidence. Successful description demands the ability to verbally convey evidence clearly and convincingly. The officer's challenge is to communicate observational evidence to people who weren't there to see, hear, or smell the evidence themselves. The officer's tools are words. These words make up the written report and verbal testimony which the officer uses to "paint a word picture" when communicating with the prosecutor, the judge, the members of the jury, and the defense attorney. This skill allows these people to develop a sharp mental image that allows them to "see," "hear," and "smell" the evidence. Successful DWI describers have the verbal skills needed to use descriptive words and phrases to communicate their evidence clearly and convincingly.

This training will help officers become more skillful at detection and description, make more DWI arrests, and obtain more convictions. These actions will lead to greater DWI deterrence through less impaired driving and fewer crashes, injuries, and deaths.

ADMINISTRATOR'S GUIDE – P.10

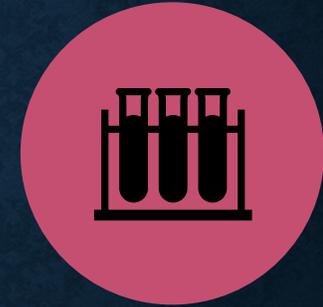

SUCCESSFUL DWI
DETECTORS ARE
THOSE OFFICERS
WHO KNOW

WHAT TO LOOK
AND LISTEN FOR,

WHO HAVE
THE SKILLS TO ASK
THE RIGHT
QUESTIONS,

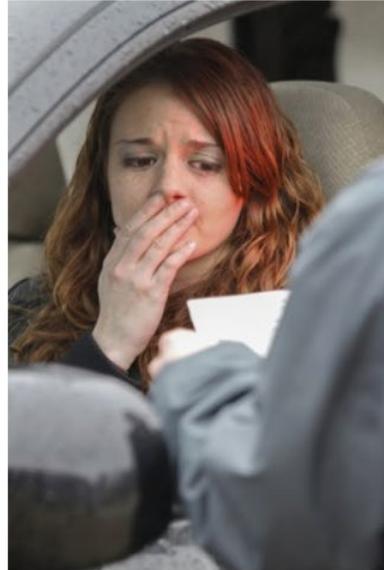

AND CHOOSE AND
USE THE RIGHT
TESTS.

VEHICLE
IN
MOTION**

Most Common and Reliable Initial Indicators of DWI

- Problems in maintaining proper lane position
- Speed and braking problems
- Vigilance problems
- Judgment problems

- 24 Cues
- 4 Driving Behavior Categories

DWI DETECTION GUIDE

Weaving plus any other cue: $p =$ at least .65

Any two cues: $p =$ at least .50

Problems Maintaining Proper Lane Position $p = .50-.75$

- Weaving
- Weaving across lane lines
- Straddling a lane line
- Swerving
- Turning with a wide radius
- Drifting
- Almost striking a vehicle or other object

Speed and Braking Problems $p = .45-.70$

- Stopping problems (too far, too short, or too jerky)
- Accelerating or decelerating for no apparent reason
- Varying speed
- Slow speed (10+ mph under limit)

Vigilance Problems $p = .55-.65$

- Driving in opposing lanes or wrong way on one-way
- Slow response to traffic signals
- Slow or failure to respond to officer's signals

- Stopping inappropriately in response to officer
- Inappropriate or unusual behavior (throwing, arguing, etc.)
- Appearing to be impaired

Post Stop Cues $p \geq .85$

- Difficulty with motor vehicle controls
- Difficulty exiting the vehicle
- Fumbling with driver's license or registration
- Repeating questions or comments
- Swaying, unsteady, or balance problems
- Leaning on the vehicle or other object
- Slurred speech
- Slow to respond to officer or officer must repeat
- Providing incorrect information, changes answers
- Odor of alcoholic beverage from the driver

$p \geq .50$ when combined with any other cue:

- Driving without headlights at night
- Failure to signal or signal inconsistent with action

The probability of detecting DWI by random traffic enforcement stops at night has been found to be about 3 percent (.03).

The probability of detecting DWI by random traffic enforcement stops at night has been found to be about 3 percent (.03).

Weaving plus any other cue: $p =$ at least .65

Any two cues: $p =$ at least .50

$p \geq .50$ when combined with any other cue:

- Driving without headlights at night
- Failure to signal or signal inconsistent with action

CRASH SCENARIO

A witness reports, that prior to the crash, they had observed the vehicle driving without headlights, weaving across lane lines, and speeding.

Based on these driving actions, what is the likelihood the driver has a BAC above 0.08?

Weaving across lane lines = 50% – 75%

No headlights = 55% - 65%

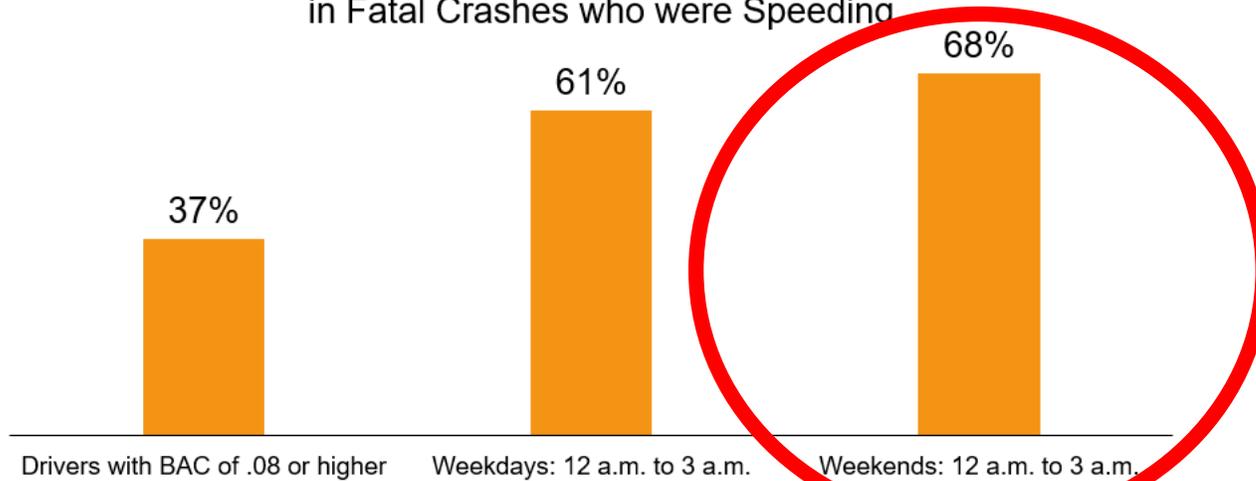

Both together = At least 65%

alcohol

QUESTION 4

Can I check your eyes to make sure you're good to drive?

- “Nystagmus check”
- Advanced technique
- Not part of the basic training
- Not endorsed by IACP or TAP, but has been reviewed
- Has been used for years
- Officer Safety

QUESTION 4

Can I check your eyes to make sure you're good to drive?

- “Tell the subject:
 - to keep head still
 - follow finger with eyes
 - Rotate shoulder towards you if head is turned past 45 degrees
 - Keep head level (ears level with shoulders)
- Move finger to B pillar, hold (min. 4 sec.), then cross to A pillar, hold, back to center
- Looking for the presence of nystagmus

Nystagmus testing in intoxicated individuals

Karl Citek, O.D., Ph.D.,^a Bret Ball, O.D.,^a and Dale A. Rutledge, Lieutenant^b

^aCollege of Optometry, Pacific University, Forest Grove, Oregon and ^bthe Oregon State Police, Wilsonville, Oregon

GOAL:

**TO ESTABLISH THE VALIDITY AND RELIABILITY OF HGN
AND VGN IN THE SEATED AND SUPINE POSTURES...**

Figure 1 Demonstration of Horizontal Gaze Nystagmus test in seated posture.

In the seated posture, the subject sat in an armless chair or folding chair, with head upright and turned approximately 45 degrees to the side. The evaluator stood to the same side as the subject's turned head, such that the subject always directly faced the evaluator (see Figure 1).

SEATED HGN

Positional alcohol nystagmus (PAN)

Officers normally do not assess PAN, but it is mentioned in the training manual as a type of nystagmus of which they must be aware.⁴ PAN may

be induced in an alcohol-impaired individual when the head is tilted with respect to straight ahead, with the nystagmus present in primary gaze. Previous research has demonstrated that PAN is not induced in a supine posture, when the head is in line with the body.¹⁸ The presence of PAN is easily differentiated from the types of nystagmus expected during the HGN and VGN tests due to the non-upright head position and straight-ahead gaze.

POSITIONAL ALCOHOL NYSTAGMUS (PAN)

Table 3. Sensitivity, false alarm rate, accuracy, and detectability index for HGN data at each test posture at two criterion blood alcohol concentration (0.08% and 0.10%)*

	Posture		Supine	McKnight et al.
	Standing	Seated		
BAC = 0.08%				
Sensitivity	0.890	0.799 ↓	0.891	0.75
False alarm rate	0.367	0.285 ↓	0.462	0.32
Accuracy	77.3%	76.1% ↓	73.0%	71%
<i>d'</i>	1.568	1.407 ↓	1.326	1.15
BAC = 0.10%				
	Standing	Seated	Supine	Good and Augsburg
Sensitivity	0.956	0.887 ↓	0.969	0.96
False alarm rate	0.503	0.408 ↓	0.561	0.82
Accuracy	64.7%	68.9% ↑	61.3%	90%
<i>d'</i>	1.698	1.442 ↓	1.708	0.88

d', Detectability index; *HGN*, horizontal gaze nystagmus; and *BAC*, blood alcohol concentration.

* Included for comparison are calculations based on the data recorded by McKnight et al.,²⁹ testing in a seated posture, and Good and Augsburg, 5 testing in a standing posture.

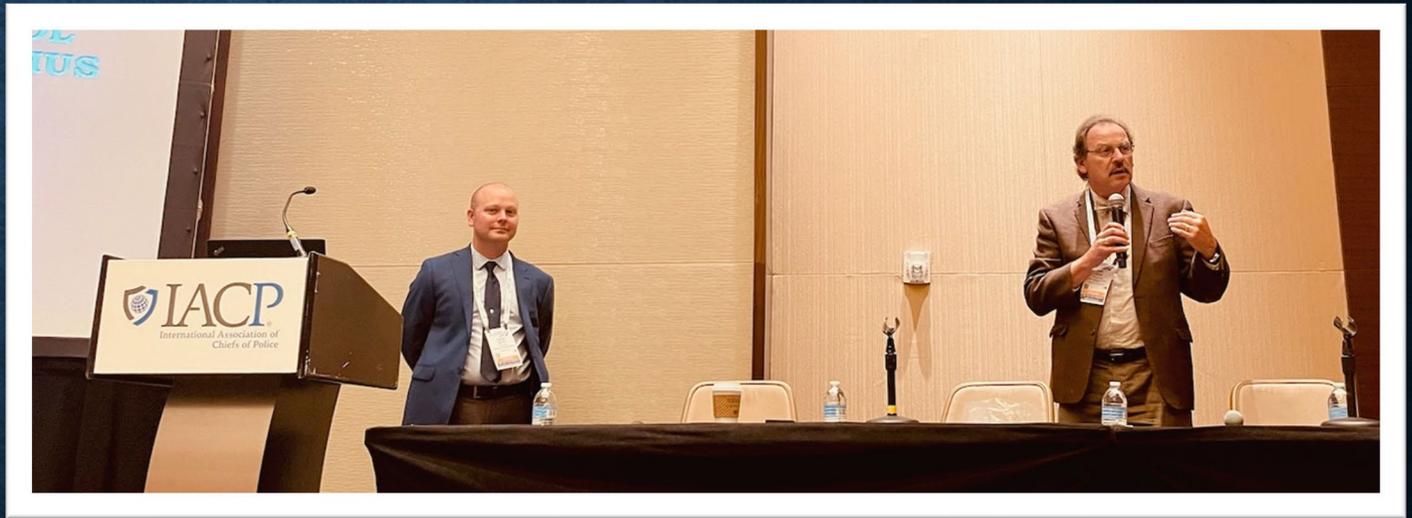

Nystagmus Testing in Intoxicated Individuals:

“We conclude that the proper use of the HGN and VGN tests at any test posture will help an officer correctly identify individuals impaired with alcohol at BACs of 0.08% and higher.”

“Results are presented to demonstrate that officers can correctly identify and distinguish PAN from other types of nystagmus.”

Figure 1 Demonstration of Horizontal Gaze Nystagmus test in seated posture.

Source:

Citek, K., Ball, B., & Rutledge, D.A. (2003, November). Nystagmus Testing In Intoxicated Individuals. *Optometry*, 74(11), 695-710.

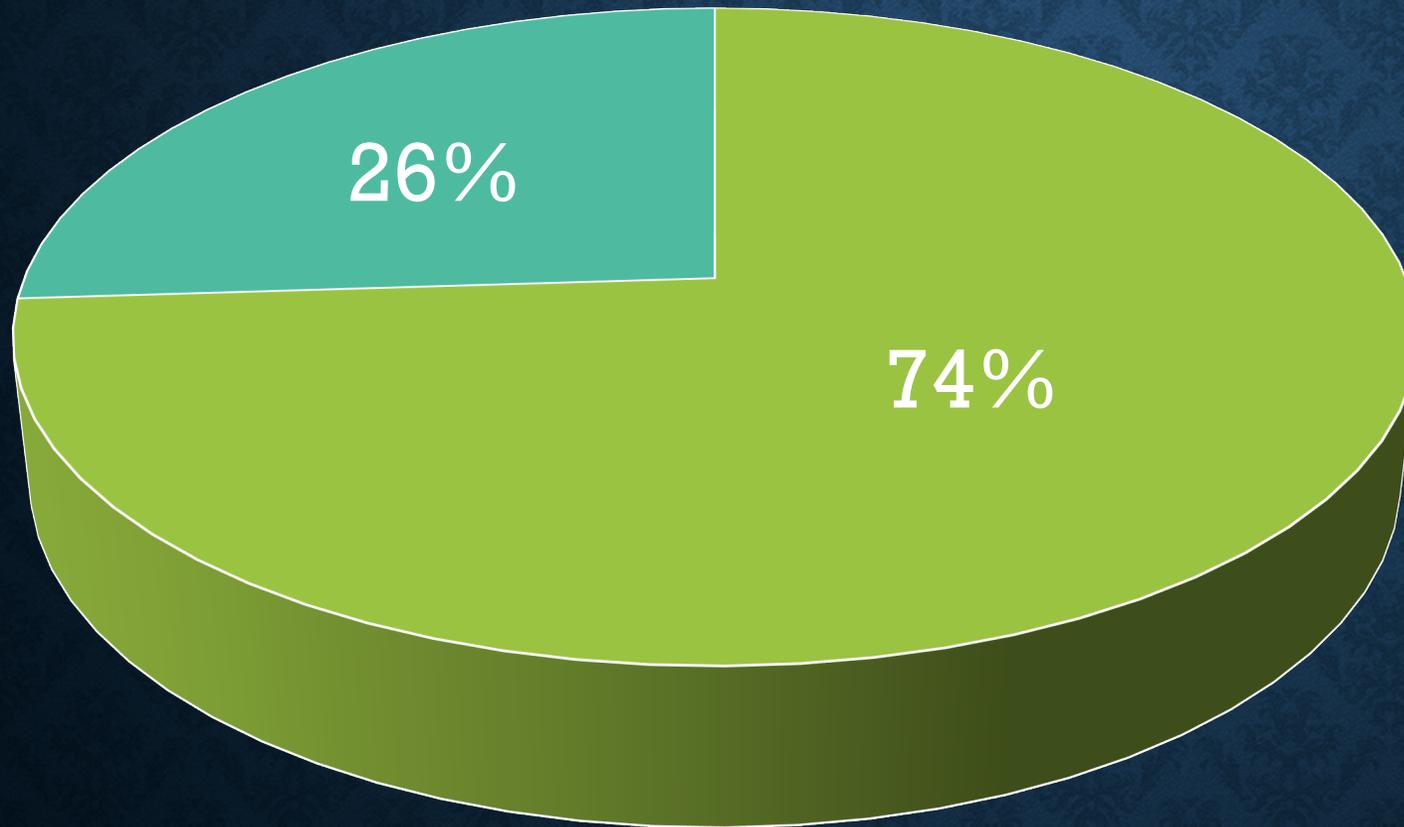

An example of PAN is the spinning of a room when a person lies down after consuming alcohol.
